REASONS FOR ALLOWANCE

1. The prior art of record (US Patent # 6,870,817) relates to a method and apparatus for monitoring calls over a session initiation protocol network. As to claims 1-19, the prior art of record does not teach a) creating a data flow table having an entry for each unique data flow, where each data flow entry includes fields selected from the group of fields consisting of origin IP address, destination IP address, time-to-live value, packet length, packet number, start time, stop time, origin port, destination port, protocol, any other suitable value and any combination thereof; d) adding at least one error field to the data flow table that corresponds with the at least one field of the data packet identified in step c) that is outside of the at least one user-definable set of values; e) entering in the at least one error field the at least one field of the data packet identified in step c) that is outside of the user-definable set of values; g) comparing at least one corresponding entry in the data flow table to the at least one field of the data packet entered into the data flow table in the last step; j)
